AI VIDEO STUDIO · NAME TBD · PREPARED 2026-10-29

Infrastructure, funding *and launch plan.*

Everything the studio needs to run: on its own servers, on managed hosting, and in the stages between. Plus how to make customer payments fund the AI vendors, how to keep a video-heavy site fast, and the conversion patterns worth borrowing.

CONTENTS

1. What you won't like 2
2. Customer-funded cash flow 3
3. Launching with near-zero CAC 5
4. System map 6
5. Full component list 7
6. Option A: our own servers 9
7. Option B: managed hosting 10
8. Ways to run it until we're self-hosted 11
9. Fast video, Higgsfield-style conversion 12
10. Visual references 14
11. Launch checklist 16
Sources 16

Confidence tags: `CERTAIN` hard evidence or our own math · `LIKELY` strong inference from several sources · `GUESSING` an assumption to replace with real data. Hosting and server prices are list prices that change often. Re-quote before you sign anything.

1 · READ THIS FIRST

What you *won't like.*

Five facts that shape every decision in this document.

1. Customer money can pay the vendors, but not on day one.

CERTAIN Stripe pays out a new account's first charges about **7 days** after the first payment, up to **14 days** in some industries. After that, US payouts run on a 2-business-day rolling schedule. Most AI vendors (fal, BytePlus) are **prepaid**. That leaves a gap of one to two weeks where customers have paid you but you can't touch the money yet. You need a small starting float, typically **$5–10k** (§2.3). Or you shrink the gap: charge founder seats only at launch, pay Google on its monthly invoice, and ramp usage with $1 trials first.

2. Prepaid cash isn't yours yet.

CERTAIN When a founder pays for a month, or a customer pays a year up front, you owe them credits. Until those credits are used, the money is a liability (deferred revenue), not profit. Prepaid businesses fail when they spend next month's obligations on this month's salaries. §2.2 has the rules that stop that.

3. Your own servers don't save money at the start.

LIKELY AI model fees will be **80–90%+ of your cost of goods**; servers are a rounding error next to them. A self-hosted stack costs roughly €400–600/mo in hardware plus someone who can run it. Managed hosting starts near $0–150/mo with no operations hire. Self-host the heavy, steady pieces (database, video workers, open-weights models) once the numbers justify it, not before (§6–8).

4. Near-zero acquisition spend means slow growth.

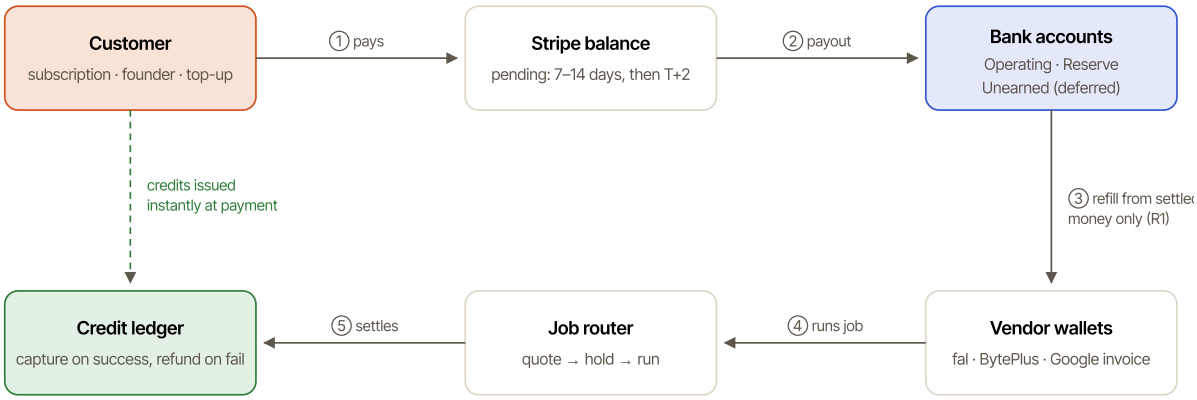

GUESSING Organic, referral and creator-credit channels can realistically get you to a few hundred founders in the first 90 days. That's enough to prove demand and fund the vendors. It is **not** the curve that reaches $250M. That curve needs the capital raise you're planning, spent on paid acquisition once retention data shows it pays back.

5. Higgsfield's look converts. Some of their tactics are a liability for us.

CERTAIN Their live pricing config uses deadline badges ("Buy until: Oct 30"), "70% cheaper" and "BEST VALUE" labels, strike-through prices, "UNLIMITED" badges and auto-refill as the default way to buy. Borrow the **visual** patterns: the autoplay grid, badges, strike-through, sticky call-to-action, live counters. Skip fake-unlimited offers and fake urgency. Our brand promise is honesty, and the FTC treats fake scarcity as a dark pattern (§9).

The customer-funded *cash loop.*

Customers pay first. Credits are issued immediately. Vendor wallets are refilled only from money Stripe has actually paid out. Nothing is spent that hasn't been collected.

2.1 Which vendors bill how

VENDOR	BILLING	CASH EFFECT
fal.ai	Prepaid credit wallet LIKELY	Must be funded before jobs run, so keep 3–5 days of runway
Google (Gemini API / Vertex: Nano Banana, Veo)	Cloud billing account, invoiced monthly after usage LIKELY	**Natural float:** customers pay this month, Google is paid next month
BytePlus ModelArk (Seedance), Kling API	Prepaid resource packs or top-ups LIKELY	Fund in small packs and grow as volume grows
Higgsfield API	Prepaid dollar wallet, $5 minimum LIKELY	Same treatment as fal
Hosting (Vercel, Supabase, Cloudflare)	Monthly invoice or card	Small amounts, paid from operating

2.2 Cash rules (enforce these in code and in banking)

1. **R1: Settled money only.** Vendor wallets are refilled only from money Stripe has paid out, never against pending balance or credit lines.
2. **R2: Reserve.** Hold 10% of the last 30 days' collections in a separate reserve account for refunds and chargebacks. Stripe may also hold its own reserve on a new AI or subscription account.
3. **R3: Runway alarm.** When any vendor wallet drops below 3 days of usage, auto-refill it from operating. If operating can't cover it, the router moves real-time jobs to the Saver queue and pauses new trials. It never overspends.
4. **R4: Unearned cash is locked.** Annual prepayments go to an "Unearned" account and move 1/12 per month into operating. The provider cost of credits customers actually use may be drawn early.
5. **R5: Pay postpaid where you can** (Google, hosting) and prepaid only where you have to.
6. **R6: Pre-sell founder seats without holding money.** Save the customer's card with a Stripe SetupIntent and charge it on launch day. No money is held for a product that doesn't exist yet, which keeps you clear of pre-order holds and refund disputes.

2.3 How much float the first two weeks need

CERTAIN math GUESSING inputs Typical vendor cost for one active user: Pro, 13,500 credits, 65% used, at $0.00625 wholesale per credit, comes to about **$55 a month**, or about **$26 over the 14 days** before Stripe's first payout.

LAUNCH COHORT (PAYING)	COLLECTED AT LAUNCH	VENDOR COST, FIRST 14 DAYS	FLOAT NEEDED (COST MINUS GOOGLE'S SHARE)
100 founders	≈ $20k	≈ $2.6k	≈ $1.7k
300 founders	≈ $60k	≈ $7.7k	≈ $5k
1,000 founders	≈ $200k	≈ $26k	≈ $17k

Assumes about 35% of usage runs on Google, which invoices next month. Two levers bring the float down: open with a $1 seven-day trial week (500 credits each, about $3 of vendor cost per user), and cap the first cohort size.

$5–10k
recommended starting float for a 300-founder launch

3–5 days
vendor wallet runway to keep at all times

10%
of trailing 30-day collections held in reserve

2.4 Bank and money tooling

NEED	USE	WHY
Business bank with sub-accounts	Mercury, Relay or similar	Separate Operating / Reserve / Unearned accounts, with rule-based auto-transfers for R2 and R4
Payments and subscriptions	Stripe Billing + Checkout + Customer Portal + Radar + Tax	Subscriptions, top-ups, one-click cancel, fraud filtering and sales tax
Deferred revenue reporting	Stripe Revenue Recognition, or the ledger export	Shows how much cash is unearned at any moment
Vendor payments	A business card with spend limits per vendor	Caps the damage if a key leaks. Every vendor gets its own card.

What changes after the capital raise

The cash rules stay. The raise funds three things customer money shouldn't: **(1)** committed-spend vendor contracts (a 20–50% discount in exchange for prepaying 6–12 months GUESSING), **(2)** paid acquisition ahead of revenue, and **(3)** salaries. Customer cash keeps funding the cost of what customers use.

Every channel *pays for itself* or costs only time.

The rule: no cash goes out for acquisition before a customer has paid. Creators and referrers get paid in credits, which cost about 62¢ per $1 of face value, or in a commission taken from revenue that has already come in.

CHANNEL	CASH COST	HOW IT'S PAID	FIRST 90 DAYS
Hglif3 audience (store, email, socials)	$0	—	Founder waitlist and the first 50 beta users
Build in public (TikTok, Reels, X)	$0	Time. Every post is made with the product.	3 posts a day showing prompt → result → receipt
Creator seeding (CAC test, capped at $9k)	credits	Free Pro for 2 months in exchange for content rights	50 creators
Member referrals	credits	5% of the referred user's plan credits for 12 months	Built into every account
Affiliates	from revenue	20% of collected revenue for 12 months, paid 30 days after the customer pays	30 AI-tool creators
SEO: model price index and comparison pages	$0	Generated from pricing.json each week	20 pages
MCP registries, Claude connector directory	$0	Listing	Agent builders
Shopify App Store, WooCommerce marketplace	$0 to list	Platform revenue share on in-app billing LIKELY	Month 3
Discord community and weekly contests	credits	Contest prizes paid in credits	Ongoing
$1 seven-day trial (CAC test, capped at $5k)	≈ $3/trial	Vendor cost of 500 credits	Kill it if fewer than 15% convert

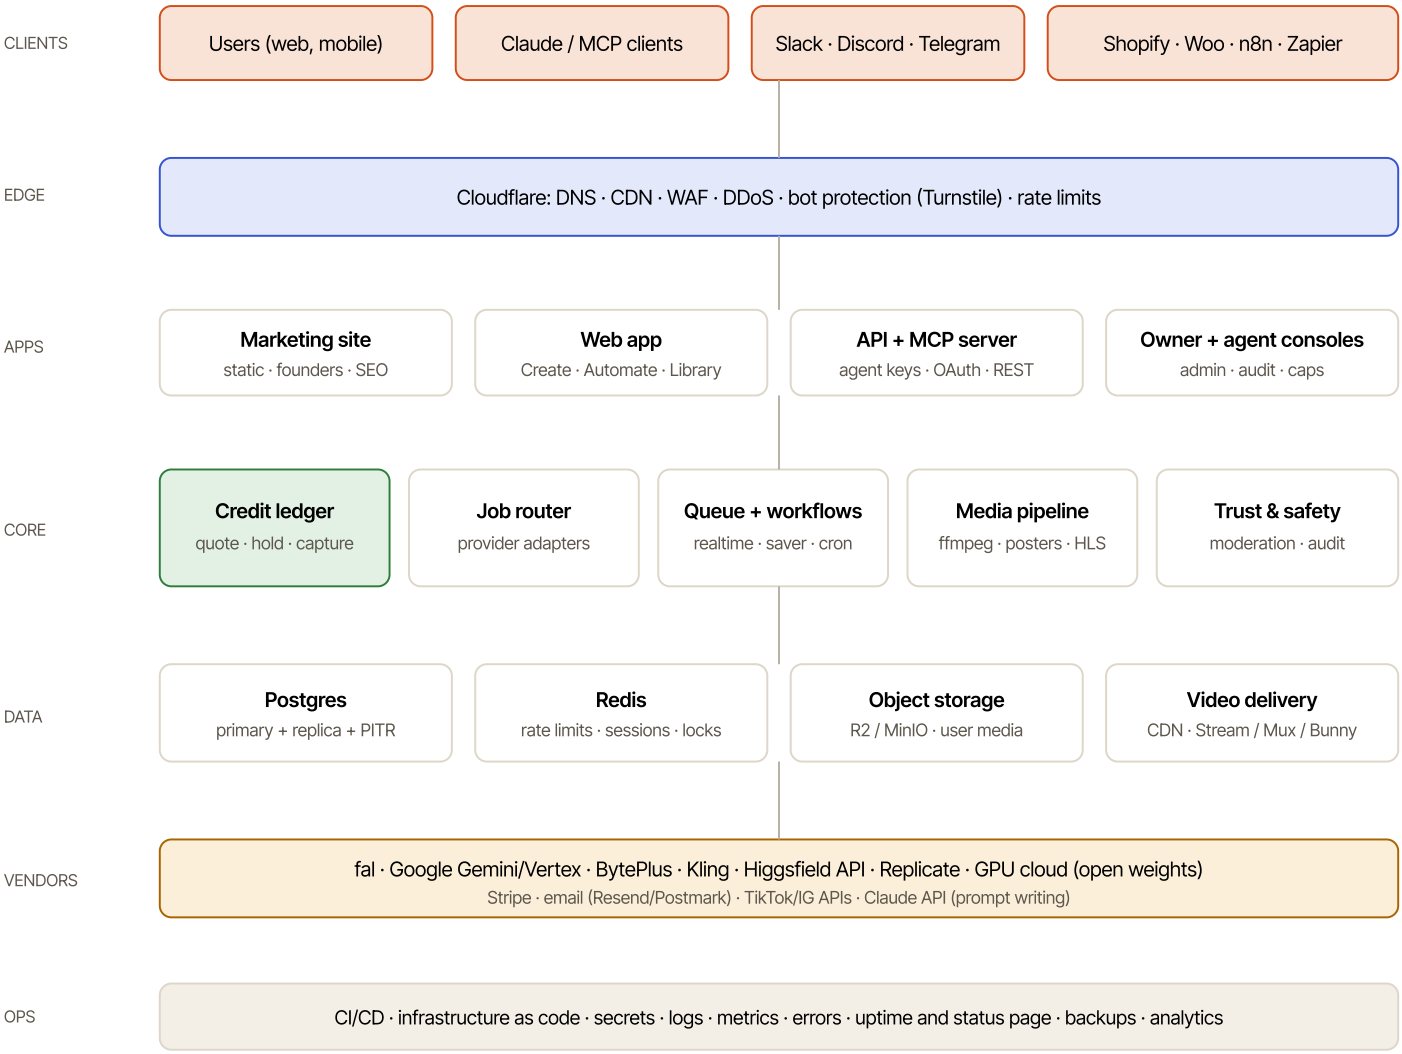

Total cash at risk before revenue: $14k, capped

These are the two CAC tests already in `pricing.json`. Everything else is time, credits, or a share of revenue already collected. The profit check (`economics.py --check`) still guarantees every paid plan clears at least a 25% margin with every credit spent.

4 · SYSTEM MAP

Every part of the studio, *in layers.*

The same layers exist whether they run on our own servers or on managed hosting. Only who operates them changes.

5 · FULL COMPONENT LIST

Everything the studio needs *to run on its own.*

Each component with the self-hosted choice (Option A) and the managed choice (Option B). Bold rows are required for launch. The rest can follow.

#	COMPONENT	JOB	SELF-HOSTED (A)	MANAGED (B)
EDGE & WEB				
1	**DNS, CDN, WAF**	Speed, DDoS and bot protection	Cloudflare (free → Pro). Same in both options.	
2	**Marketing site**	Home, founders, pricing, SEO pages	Static files on Nginx/Caddy	Vercel / Cloudflare Pages
3	**Web app**	Create · Automate · Library · billing	Next.js in Docker (Node)	Vercel
4	**Auth**	Sign up, login, OAuth, 2FA	Auth.js / Lucia + Postgres	Clerk / Supabase Auth
API & AGENTS				
5	**Public API**	REST endpoints mirroring the MCP tools	Node/Go service	Vercel functions / Fly.io
6	**MCP server**	Claude connectors and headless agents	Streamable-HTTP service	Same, on Fly.io / Railway
7	**Agent keys and caps**	Scopes, per-job and monthly caps, approvals	Part of the API plus Postgres tables	
8	Webhook dispatcher	Signed job and workflow events with retries	Worker + queue	Svix / Inngest
9	Chat bots	Slack, Discord, Telegram	Small services calling the API	
CORE				
10	**Credit ledger**	Balances, holds, refunds, expiry	Postgres, append-only, in transactions	
11	**Pricing service**	Live price per job, profit-rule floor	pricing.json plus live vendor price table	
12	**Job router + vendor adapters**	Cheapest healthy vendor, failover	Service plus one adapter per vendor	
13	**Queue + workflow engine**	Realtime and saver lanes, retries, cron	Temporal / BullMQ + Redis	Inngest / Trigger.dev
14	**Media pipeline**	Download outputs, transcode, posters, thumbnails	ffmpeg workers	Cloudflare Stream / Mux
15	**Moderation**	Prompt and output checks, blocklists	Open classifiers on workers	Vendor moderation + Hive / OpenAI moderation
16	Store connectors	Shopify app, WooCommerce webhooks	Service plus OAuth apps	
17	Social publishing	TikTok / IG draft uploads	Platform APIs (app review needed)	
18	Open-weights GPU lane	Cheap Saver-queue video and images	Owned GPUs (later)	RunPod / Modal / Lambda on demand

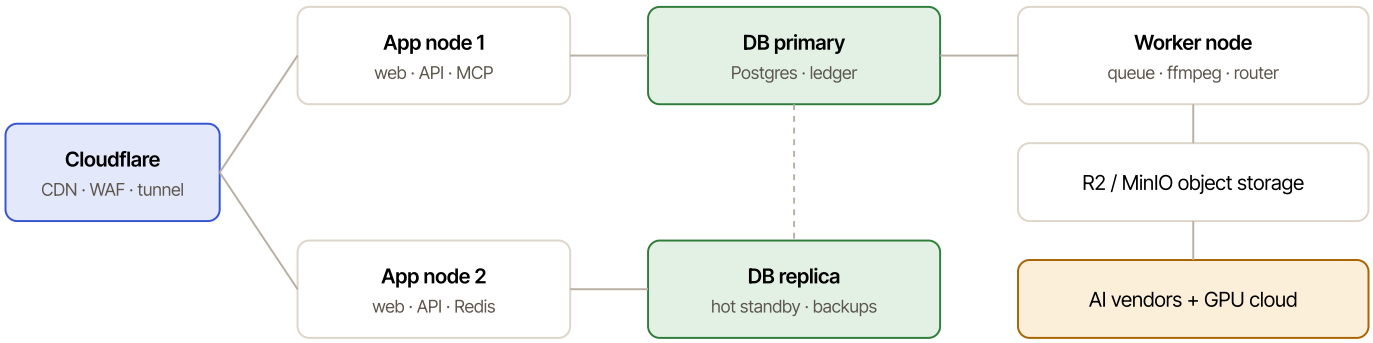

#	COMPONENT	JOB	SELF-HOSTED (A)	MANAGED (B)
DATA				
19	**Postgres**	Users, ledger, jobs, workflows	Postgres 16 + streaming replica + pgBackRest	Supabase / Neon
20	**Redis**	Rate limits, locks, sessions, queue	Redis / Valkey	Upstash
21	**Object storage**	Uploads and generated media	MinIO (or keep R2)	Cloudflare R2 ($0.015/GB-mo, no egress fees) CERTAIN
22	**Video delivery**	Fast playback of site loops and user videos	R2 + CDN, self-encoded MP4/WebM	Cloudflare Stream ($5/1k min stored, $1/1k min delivered) CERTAIN
23	Search	Library search	Postgres full-text / Meilisearch	Same
MONEY				
24	**Billing**	Plans, founders, top-ups, tax, portal	Stripe (always managed)	
25	**Fraud**	Card testing, free-trial farming	Stripe Radar + Turnstile + phone/card checks	
26	Banking	Operating / Reserve / Unearned accounts	Business bank with sub-accounts (§2.4)	
OPERATIONS				
27	**CI/CD**	Tests, profit check, deploys	GitHub Actions	
28	Infrastructure as code	Rebuild servers from scratch	Terraform + Ansible / Coolify	Mostly vendor dashboards
29	**Secrets**	API keys for every vendor	Vault / SOPS	Doppler / 1Password / platform env vars
30	**Errors + logs + metrics**	Know when something breaks	Grafana + Prometheus + Loki	Sentry + Better Stack / Axiom
31	**Uptime + status page**	Public status, alerts	Uptime Kuma	Better Stack / Instatus
32	**Backups**	Database point-in-time restore, media	pgBackRest → off-site bucket	Included (check retention)
33	Product analytics	Funnels, retention	PostHog self-hosted	PostHog Cloud (free tier)
34	**Email**	Receipts, alerts, login links	Postfix (not recommended)	Resend / Postmark
35	Support	Help desk, docs bot	Chatwoot	Crisp / Intercom
LEGAL & TRUST				
36	**Policies**	Terms, privacy, refund, founder terms, DMCA agent	Lawyer-reviewed documents. Founder terms say "credits, not equity."	
37	**Audit log**	Every job, agent call and spend	Postgres append-only + export	

23 bold components are needed for launch. The 14 others can follow within the first 90 days.

6 · OPTION A

Running the studio *on our own servers.*

A small dedicated-server cluster behind Cloudflare. Billing, email and the AI vendors stay external, because nobody self-hosts those.

SERVER	CLASS (EXAMPLE)	SPEC	≈ MONTHLY
App node × 2	Hetzner AX42/AX52 class	8 cores · 64 GB · NVMe	€65–80 each GUESSING
DB primary + replica	Hetzner AX102 class	16 cores · 128 GB · NVMe RAID	€125–135 each LIKELY
Worker node	AX52 class	ffmpeg, queue workers	€65–80 GUESSING
Backups	Off-site bucket / storage box	Database PITR + configs	€10–25
GPU for open-weights video	Rented H100 / L40S hourly	Saver queue only, scales to zero	usage-based
Total hardware			**≈ €450–550**

You have to operate

- OS patching and security updates
- Database failover drills and restore tests
- On-call when a node dies at 3 a.m.
- Capacity planning and hardware swaps

The real cost is the person: a part-time DevOps contractor or a strong backend engineer.

Worth it when…

- Managed bills pass about $1.5–2k/mo GUESSING
- Video transcoding volume is steady and high
- You run open-weights models 24/7
- You've raised money to hire the operator

Hetzner raised prices in April and June 2026. Re-quote before you order. LIKELY

7 · OPTION B

Running the studio *on managed hosting.*

Every component rented from a platform that runs it for you. Fastest to launch and cheapest at low volume. The cost grows with usage.

LAYER	SERVICE	LAUNCH	~1,000 SUBS
Site + web app	Vercel (Pro)	$20	$20–150
Database + auth	Supabase Pro (or Neon + Clerk)	$25	$60–200
Queue + workflows + cron	Inngest / Trigger.dev	$0	$50–150
Redis	Upstash	$0	$10–40
API / MCP / bots	Fly.io or Railway	$5–20	$30–100
Media storage	Cloudflare R2	$0–5	$15/TB
Video delivery	Cloudflare Stream	$5	see §9
Errors, logs, uptime	Sentry + Better Stack	$0	$30–80
Email, analytics, support	Resend · PostHog · Crisp	$0	$20–100
Total platform		**≈ $55–75/mo**	**≈ $250–850/mo**

Platform list prices `LIKELY` from published plans. Verify them at signup. Payment fees (2.9% + 30¢) and AI vendor costs are separate and already modeled in `economics.py`.

Why start here

- Live in weeks, with no operations hire
- Scales to zero when nobody is using it
- Backups, failover and TLS are handled for you
- At 1,000 subs this is about 0.5% of MRR

Watch out for

- Bandwidth fees on video. Keep media on R2 or Stream, never on Vercel.
- Function timeouts. Long jobs belong in the queue, not in API routes.
- Lock-in. Keep the ledger as plain Postgres so it can move.

Recommendation: B now, hybrid at about $1.5k/mo, A for the heavy pieces after the raise

Move in this order, one at a time: **(1)** ffmpeg and media workers, **(2)** open-weights GPU inference, **(3)** Postgres. The web app, edge, billing and email can stay managed forever.

8 · WAYS TO RUN THE SITE UNTIL WE CAN FULLY SUPPORT IT OURSELVES

Borrow first, *own later.*

Each stage has a clear trigger to move to the next. You can launch at Stage 0 this week.

Stage 0: launch this week on borrowed tools ($0–50/mo)

OPTION	WHAT IT DOES FOR US	LIMITS
Static site on Cloudflare Pages or Vercel (free)	Host the designed home and founders pages today, unchanged	No accounts yet
Existing Hglif3.com WordPress (connector already live)	Waitlist page and blog on a site you already run. Zero new hosting.	Ties the brand to Hglif3 until we move
Framer or Webflow	Visual editing for the marketing site without a developer	Weak for app logic. Marketing only.
Stripe Checkout in setup mode / Payment Links	Save founder cards now, charge at launch (rule R6)	Manual seat tracking at first
Tally / Typeform + Airtable	Waitlist, onboarding survey, seat counter source	Data moves into Postgres later
Concierge generation	Beta users submit briefs. We run them on fal, the Higgsfield API or Higgsfield's MCP inside Claude, and deliver by link.	Doesn't scale past ~50 users, but proves what people pay for
Discord server	Community, support and the founders room, with nothing to build	—
Higgsfield / fal web apps	Make launch videos for the hero wall and social posts now	Check their commercial-use terms

Stage 1: managed MVP (weeks 2–12)

- Option B stack (§7), with **one vendor (fal)** covering most models at launch. Add Google direct for Nano Banana and Veo (monthly invoice float), then BytePlus.
- Use **Stripe Customer Portal** instead of building a billing UI, and Clerk or Supabase for auth instead of building login.
- MCP server and agent keys on Fly.io. Bots come later.

Stage 2: hybrid (from ~$1.5k/mo infra or steady video volume)

- One or two dedicated worker servers for ffmpeg and the queue. On-demand GPU for open-weights Saver-queue jobs. Database stays managed.

Stage 3: own servers (after the raise)

- Option A for compute and database, with Cloudflare, Stripe, email and the vendors still external. Hire the operator before migrating the database, not after.

Higgsfield-style conversion *without the slow site.*

Sites full of autoplaying video are slow because they download every clip on page load. The fix is to load almost nothing up front and stream only what's on screen.

9.1 Patterns worth borrowing (and the ones we skip)

Autoplay showcase wall

`LIKELY` Their gallery format. **We use it:** founders wall, home hero.

Strike-through + "Best value"

~~$149~~ **$129**	**BEST VALUE** ~~$129~~ $99	~~$49~~ $39

`CERTAIN` In their live config. **We use it:** founder vs regular.

Live counters + sticky CTA

8,996 seats left — Claim

We use it, with a **live** database count only.

Deadline badges

`BUY UNTIL OCT 30`

`CERTAIN` Theirs. **We use it only for real deadlines** (seat count, launch date).

"Unlimited" badges

~~`365 UNLIMITED`~~

`CERTAIN` Theirs, with time and model limits. **We skip it:** it breaks our honesty promise.

Auto-refill by default

~~`TURN ON AUTO-REFILL`~~

`CERTAIN` Theirs. **We make it opt-in**, with a monthly cap.

9.2 The loading rules (already built into `founders.html`)

1. **Poster first.** Every tile ships a small AVIF/WebP poster (≤ 40 KB). The video element has `preload="none"` and no src until needed.
2. **Play only what's visible.** An IntersectionObserver attaches the src and plays when a tile is 40% on screen, and pauses when it scrolls away.
3. **At most 3 playing at once.** Phones choke on more.
4. **Respect the user.** Reduced-motion or data-saver users get posters only.
5. **Short loops.** 3–6 seconds, muted, 9:16 at 480×854, H.264 for compatibility plus AV1/VP9 WebM (~30–40% smaller `LIKELY`). Target 300–600 KB per loop.
6. **HLS only for long videos** (over 15 s, or user-generated content in the library): adaptive bitrate through Stream, Mux or Bunny.
7. **Cache forever.** Content-hashed filenames, served from the CDN edge with `Cache-Control: immutable`.

9.3 Performance budget

METRIC	BUDGET	HOW
Largest Contentful Paint (4G phone)	≤ 2.5 s	Text headline is the LCP element. The hero poster loads at priority.
Initial page weight	≤ 1.5 MB	Posters only. No video bytes before the first scroll.
JavaScript	≤ 100 KB	The marketing pages are static HTML. The app bundle loads only in /app.
Cumulative Layout Shift	≤ 0.05	Fixed aspect-ratio tiles
Videos playing at once	≤ 3	Enforced in the wall script

9.4 What delivering the site's videos costs

`CERTAIN math` on Cloudflare's published rates. Example: 100,000 visitors a month, each watching 8 six-second loops, is 80,000 minutes delivered.

OPTION	STORAGE	DELIVERY	≈ MONTHLY AT 100K VISITORS	NOTES
R2 + Cloudflare CDN, self-encoded	$0.015/GB-mo	No egress fees	≈ $1–5	Cheapest. We run ffmpeg once per clip.
Cloudflare Stream	$5 / 1,000 min	$1 / 1,000 min	≈ $80	Encoding and HLS included. Easiest.
Mux / Bunny Stream	per minute / GB	per minute / GB	varies	Better analytics (Mux), cheaper bandwidth (Bunny) `LIKELY`
Vercel / app server bandwidth	—	metered bandwidth	expensive	**Never serve video from here.**

Recommendation

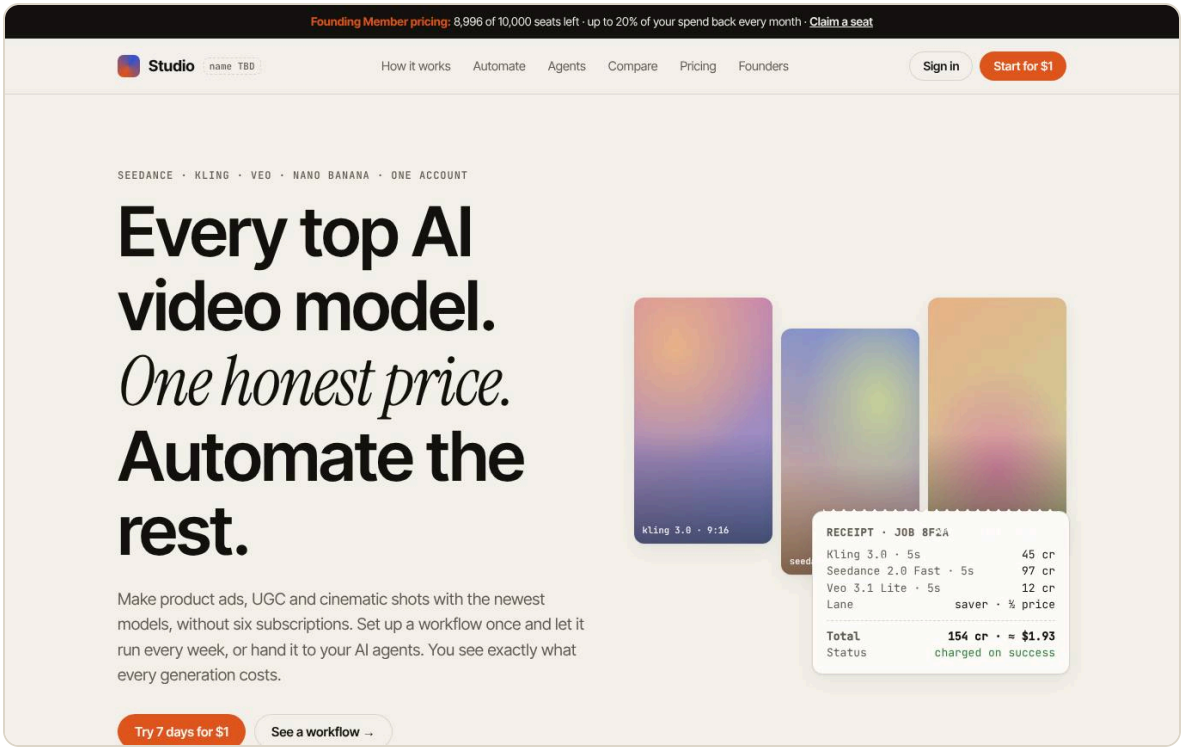

Marketing loops: **R2 + CDN**, encoded once by our own ffmpeg step (a few dollars a month). User-generated videos in the app: **Cloudflare Stream** until volume justifies self-encoding (Stage 2).

9.5 Encoding presets for site loops

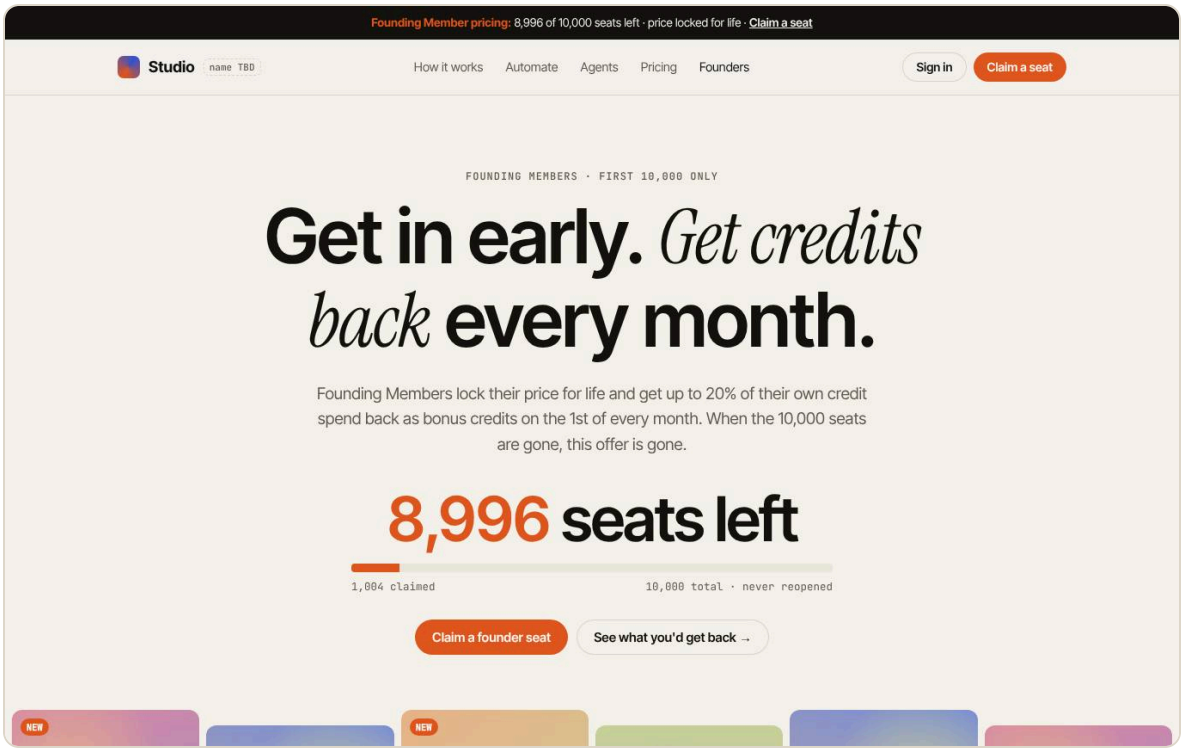

OUTPUT	COMMAND (FFMPEG)
MP4 / H.264	`ffmpeg -i in.mp4 -t 6 -vf scale=480:-2 -an -c:v libx264 -crf 28 -preset slow -movflags +faststart loop.mp4`
WebM / AV1	`ffmpeg -i in.mp4 -t 6 -vf scale=480:-2 -an -c:v libsvtav1 -crf 38 loop.webm`
Poster	`ffmpeg -i in.mp4 -frames:v 1 -vf scale=480:-2 poster.avif`

What we've designed *so far.*

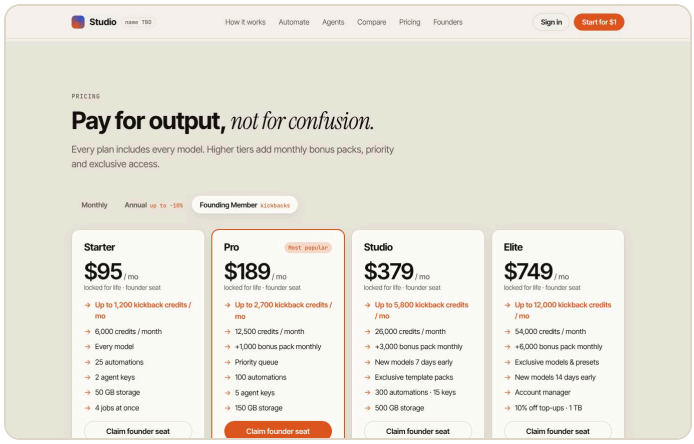

Screens from the repo (`ventures/video-broker/site` and `dashboards`). Gradient tiles are placeholders for real generated clips.

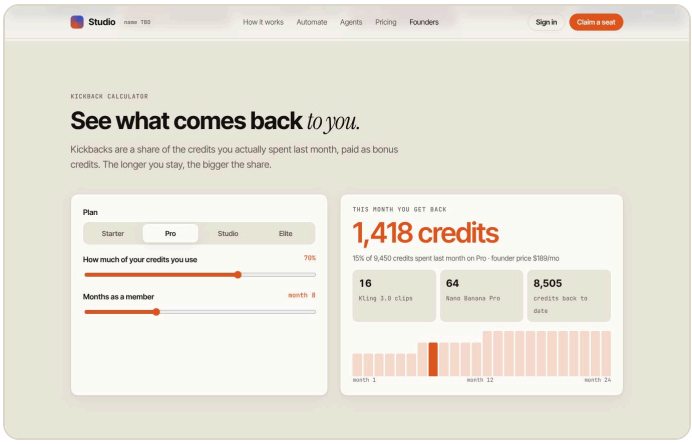

Home · hero. The receipt card is the brand signature: every job's cost is shown.

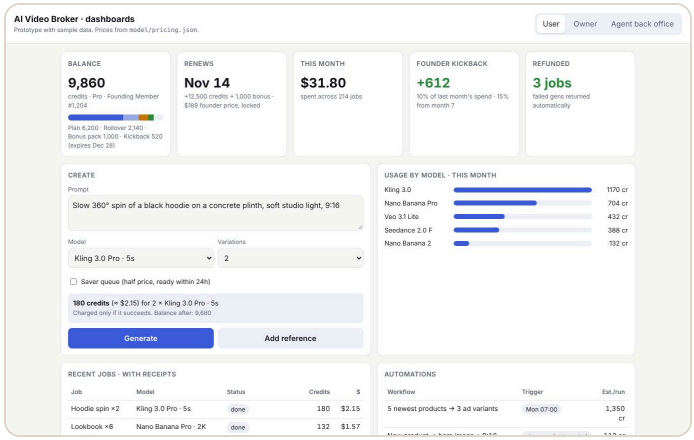

Founders · seat counter, autoplay showcase wall (Higgsfield-style), sticky call-to-action.

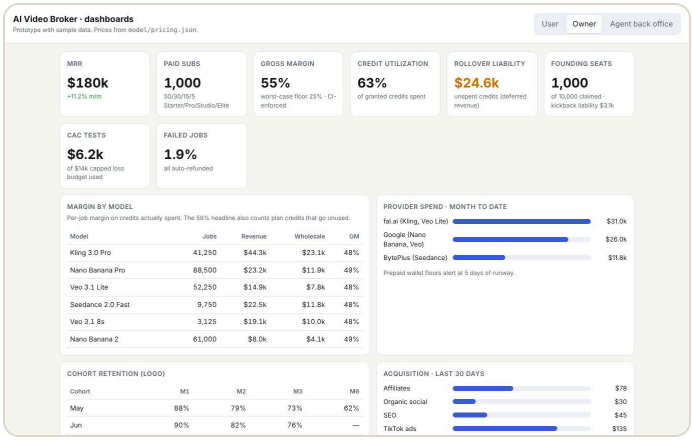

Home · pricing with Monthly / Annual / Founding Member toggle.

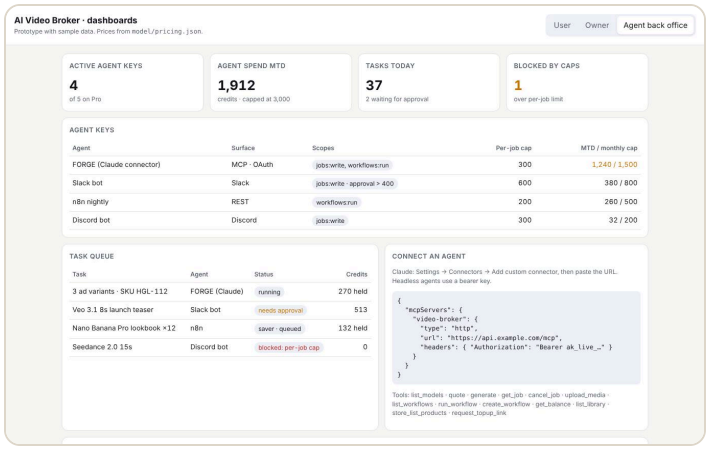

Founders · kickback calculator: plan, usage and tenure → credits back.

App · user dashboard: balance breakdown, live quote, receipts.

App · owner dashboard: MRR, margin by model, founding seats, CAC tests.

App · agent back office: keys, caps, task queue, audit log.

In order, *nothing skipped.*

Week 0–1 · Stage 0

- ☐ Put the home and founders pages on Cloudflare Pages
- ☐ Stripe account, plus setup-mode checkout for founder card saves
- ☐ Business bank with Operating / Reserve / Unearned accounts
- ☐ Founder terms reviewed by a lawyer ("credits, not equity")
- ☐ fal account plus Higgsfield API wallet for concierge jobs
- ☐ Make 12 real hero loops, encoded with §9.5
- ☐ Discord server and founders room

Weeks 2–6 · Stage 1 build

- ☐ Option B accounts: Vercel, Supabase, Inngest, R2, Sentry
- ☐ Ledger plus pricing service, with the profit check in CI
- ☐ fal adapter, then Google, with failover
- ☐ Stripe webhooks → ledger grants. Customer Portal.
- ☐ Wallet runway alarm (rule R3)

Weeks 7–12 · Stage 1 launch

- ☐ Automate tab with 5 templates. Shopify connector.
- ☐ MCP server plus agent keys with caps
- ☐ Moderation on every prompt and output. Audit log.
- ☐ Live seat counter from the database
- ☐ Status page, uptime alerts, backup restore test
- ☐ Charge saved founder cards on launch day
- ☐ Founder float in place ($5–10k, §2.3)

After launch

- ☐ Weekly: vendor price check → pricing.json → CI
- ☐ Monthly: kickbacks issued, unearned cash released
- ☐ At ~$1.5k/mo infra: plan Stage 2
- ☐ Capital raise → committed vendor contracts → paid acquisition
